# Monitoring Wastewater for COVID

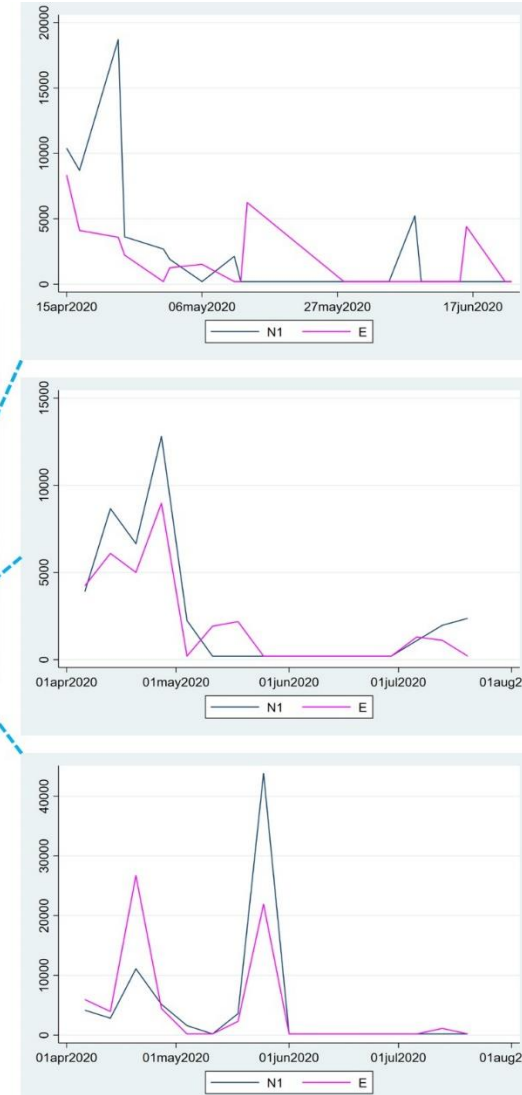

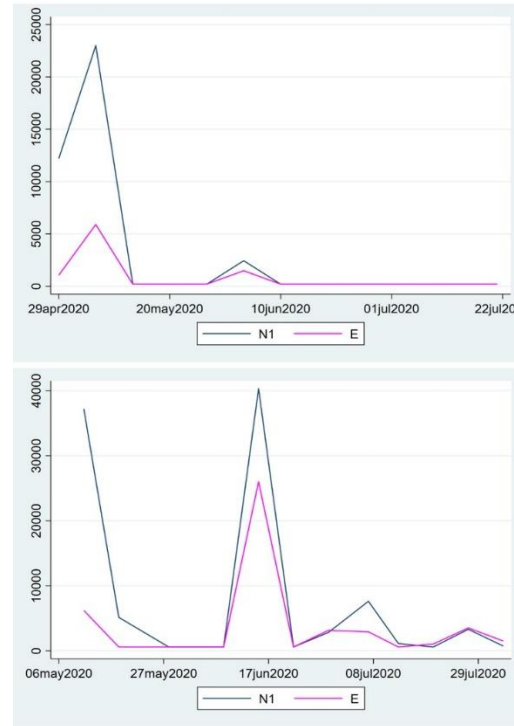

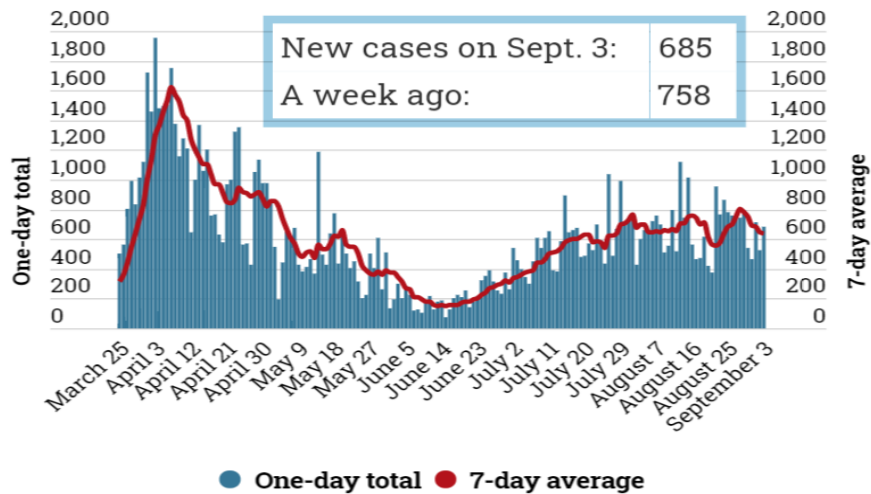

- This approach provides a leading indicator of COVID-19 cases and outbreaks, as SARS-CoV-2 is released in the feces of both symptomatic and asymptomatic individuals at an early stage of infection, and modern sewer systems efficiently collect wastewater from entire cities into centralized treatment facilities.
- Early Warning, addressing spread and
- Assessment of interventions
  - Detecting disease: Assist with Surveillance Testing and Identification and isolation
  - Reducing new cases: Physical distancing and airflow, personal protection and hygiene, closures and travel restrictions
  - Limiting mortality: Vaccines and therapies and Health-system preparedness Protecting vulnerable groups and settings
  - Tailoring interventions: For Universities
